

LP Mobile

Mobile Pick-to-Light App

Total Visibility, Remote Control

The LP Mobile app provides Lightning Pick users with real-time productivity views, operations management controls and system diagnostics through their smart phones and tablets. LP Mobile is a web application, compatible across all Android platforms.

LP Mobile gives managers a competitive advantage by keeping them connected to their Lightning Pick systems even when not in close physical proximity of the pick area or a Lightning Pick software workstation. The mobile app offers real-time dashboard style updates on their Lightning Pick-controlled operations including pick rates, area overview, order progress and other facility statistics right through their phones.

Special Features

- View Facility productivity views into Pick Rate, Order Progress, Area Overview and other Facility data.
- Manage your pick operations such as Work Plans, Employee Login/Logout, Order Details, Box Contents and more.
- Run System Diagnostics within specific areas of the pick operation, should an error occur.

LP Mobile **Mobile Pick-to-Light App**

Extended Capabilities

Besides Key Performance Indicator data views, LP Mobile actually allows managers to execute operational changes through their phones for continued optimization. Users can change work plans, log employees in or out of the system and examine order details or box contents with the appropriate order number or barcode label.

LP Mobile can even run system diagnostics within specific areas of the pick operation, should an error occur.
